Numbered examples in Markdown

Numbered examples can look like this:

- (1) Example one
- (2) Example two

We can also embed alphanumeric lists within example lists

- (3) Let's embed.
 - a. Embedded example one
 - b. Embedded example two.

The period syntax works as well:

- (4) Example four.

We can reference (4) and (2), and also forward (5). Even with some intervening text.

- (5) Is two.

Regular numbered lists keep their own numbering.

- 1. First list item
- 2. Second list item

But maybe this is confusing. Anyway, we can refer back to (1).
